

## Bechtle Public Belgium Cybersecurity

Digitalization creates large amounts of data, which must be managed in a professional and secure manner.

## No digitalization in the public sector without a plan for digital security.

As a citizen, you want to enjoy the services of various government bodies quickly and professionally. Whether it concerns filling out your tax return or applying for a document, it is important that you are helped correctly and quickly behind your PC or smartphone. In order to enable digitalisation in the public sector, Bechtel offers customised services in the field of cybersecurity.

In your organization, you need more than ever the knowledge to anticipate data leaks or cyber attacks with malware, to name just a few common types of cybercrime. Bechtel has more than 20 years of experience in customized IT solutions for the public sector. Network security solutions are increasingly a cornerstone of our services. A Security Assessment from Bechtel maps the situation of your organization clearly and understandably.

# Cybersecurity.

## Governments must manage large amounts of data securely.

Increasing digitalization creates large amounts of data that need to be managed in a professional and secure manner. This is necessary, because data and any sensitive information are exactly what hackers and cybercriminals are hunting for. It is taboo, but many boards have already faced a situation where they have to pay ransom to recover data. And if you pay this ransom as an organization, you still have no guarantee that you will get this data back intact.

Bechtel provides a reliable and unique digital security plan. Governments are therefore forced to store data in a secure manner and to secure this storage location. But how do you start doing this as a public authority? At Bechtel, we have the answer to this question and we support you with assessments, solutions and training for customized security. We help you draw up a digital security plan and give you advice in the field of IT infrastructure, IT processes and training in the field of IT security.

## Security assessment: a first step towards cybersecurity.

At Bechtle, we assess and improve the quality of your IT systems based on a Security Assessment. By means of an audit, we check whether we find interesting data or vulnerabilities. We do this in two different areas: the internal and external IT environment. With this 'threat intel', we then make the specific choices and recommendations, so that the teams within your organization can digitalize and innovate.

Fixed price and clear and understandable language Advice and the preparation of a Security Assessment is always done for a fixed and well-defined price. Without hassle and complex quotes, you know immediately where you stand. Furthermore, we guarantee that everyone responsible for IT and its security will understand the report in its entirety.

### What does IT security entail?

Cybersecurity is the practice of protecting critical systems and sensitive information from digital attacks. This means that the various components of the IT infrastructure are well secured, but also that employees know how to deal with risks adequately.

The right custom services for data centers or cloud solutions. Whether the data is in a data center or in the cloud, Bechtle always provides the right custom services. For example, storage in the cloud requires special attention. After all, working with government and administrative data in the cloud requires the highest security standards.

Bechtle works independently of manufacturers and has a large network of partners. As a result, we offer both standard products and specialized solutions for digital security in the public sector.

## Trainings on security and data protection.

At Bechtle, we do not only help you with the technical aspects. At your request as a manager within the organization, we also offer training courses on internet security and data protection. The importance of this is difficult to overestimate, because as a person you are still one of the strongest links in a system of digital security. Knowing how to respond when you receive a suspicious email and a clear policy with procedures are essential within IT policy. We are happy to help you with concrete advice and services. In summary, Bechtle stands for the following principles in its approach to cyber security:

- Prevention is better than cure. A well-thought-out and secured IT infrastructure combined with well-trained employees and specific IT profiles for internet security are a good guarantee for secure data storage. For example, consider appointing a Chief Information Security Officer.
- 24/7 detection of problems. With a Security Operation Center you protect your data in the cloud or in the data center. You can choose to run this service yourself or outsource it.
- Respond. If, despite all measures, there is a cyber attack or data breach, Bechtle task forces and crisis teams will help you solve the problem.
